FARM EMPLOYMENT RISES SEASONALLY TOTAL WORKERS STILL LESS THAN YEAR AGO WAGE RATES STEADY

Farm employment in late March was 13 percent higher than a month earlier, the Crop Reporting Board announced today. This increase was just slightly less than the usual seasonal rise from February. Number of farm workers was the smallest March estimate on record.

A total of 6,161,000 persons were working on farms during the week of March 23-29, 1958. Compared with a year earlier, there were 4 percent or 239,000 fewer total workers, 3 percent fewer family workers, and 5 percent less hired laborers. Most of this decline was due to a continuation of the downward trend in number of persons working on farms, but wet soils and cold rainy weather kept many workers out of the fields throughout much of the South and East.

Wage rates for hired farm workers about April 1 averaged 1 percent higher than a year earlier. The seasonally adjusted wage rate index was 567 percent of the 1910-14 average compared with 562 last April. There was no change in the index compared with January 1, 1958.

Every individual rate was higher than a year earlier, though changes were very small for some rates. All rates of pay, except those by the week, declined seasonally from January to April. Weekly rates, important only in the Northeast, rose slightly during the last three months. The decline in average wage rates since January was largely a seasonal change, but probably was due in part to a more abundant supply of laborers who are having trouble finding jobs in nonfarm activities. A number of areas reported a more favorable supply-demand relationship for farm labor than at any time in recent years.

With the new crop season nearly at hand, field work was delayed over a large section of the country during the week of March 23-29. Rains, wet soils and abnormally low temperatures held activity to a minimum throughout the southern and eastern parts of the country. Precipitation for the survey week totaled over an inch in most of the South and along the Pacific Coast. Southern Florida, western California and South Carolina were in the heaviest rainfall areas. Cloudy skies with frequent precipitation kept soils too wet to allow farm machinery in the fields. Very little planting had been done and reports indicate farmers are 2 to 3 weeks behind schedule in much of the Southeast. Temperatures for the week averaged above normal along the Canadian border, but below normal elsewhere. Freezing temperatures occurred as far South as southern Oklahoma and northern portions of Mississippi.

Cotton planting was active in parts of Texas, southern Arizona and was starting in the southern edge of the eastern Gulf States, when weather permitted. Corn planting was progressing slowly in the Gulf States with cool temperatures retarding germination. Planting of corn and sorghum was being rushed throughout the eastern third of Texas as soils dried. Most planting has been completed in the Coastal Bend and central areas of that State.

Cool, wet weather has retarded growth of tobacco plants in the South Atlantic and Gulf Coastal States and transplanting is getting underway later than usual. Many beds still remain to be sown in the Kentucky-Tennessee area.

Oat seeding was active across Iowa, the northern halves of Illinois and Indiana and as far north as Minnesota. Elsewhere in the Ohio, middle Mississippi and Missouri River Basins, planting was generally delayed by wet soils.

Harvest of winter vegetables was active in southern Texas. In California, conditions in the Imperial Valley were favorable for work with vegetables, but rains and wet ground hampered activities in other areas. Spring harvest of vegetables in Florida was very late and a slow-down in movement of citrus has led to some unemployment. Progress of farm work in the Pacific Northwest is still well ahead of schedule. Fruit growers are busy pruning, spraying, fertilizing, and cleaning up orchards. Considerable spring planting has been done in eastern Oregon and in the Columbia Basin. Conditions were generally favorable for maple sap running in the Northeast, but some operations were still hampered by deep snow.

For the country as a whole, the total number of persons working on farms the latter part of March was about one-eighth greater than a month earlier. Increases ranged from a low of 7 percent in the Northeast and Mountain States to 18 percent in the West South Central States. Most areas, except the South Atlantic and Mountain States, registered gains about the same as average for recent years. Adverse weather held employment down in the former region, whereas favorable winter weather in most of the Mountain States allowed farmers to get an early jump on their spring work this year.

Compared with a year earlier, there were fewer persons at work on farms in all regions except the West North Central States. Decreases ranged from only 1 percent in the East North Central and Mountain regions to a 10-percent decline in the South Atlantic States. While appearing unusual, the increase in the West North Central States was simply due to agricultural activity picking up momentum quite fast during March in Iowa, Minnesota and the Dakotas. Weather during the survey week was more favorable for outdoor activities in the northern portion of this region than almost anywhere else in the country. Both family and hired workers shared in the increase for the West North Central States. Hired workers also showed a small increase over a year earlier in the East North Central States, due to a fair amount of activity in Michigan and all across the northern portions of Illinois, Indiana, and Ohio. All other regions had fewer hired workers than during March 1957.

EXPLANATIONS 1/

Farm employment estimates of the Agricultural Marketing Service cover persons doing farm work on all farms. Mailed questionnaires are received every month from 20,000 to 25,000 farmers who report the number of persons working on their farms during the last complete calendar week ending at least one day before the end of the month. The Census of Agriculture and interview surveys of farmers are used to provide bench mark data on employment.

All farm operators spending any time during the survey week at farm work, chores, or in the transaction of farm business are counted as employed. Members of the operator's family or household doing unpaid farm work or chores are counted if they put in 15 hours or more during the week. Working operators plus unpaid members of their families or households who meet these criteria are called family workers. All persons doing one or more hours of farm work or chores for pay during the week are counted as hired workers.

The data on farm employment published by the Agricultural Marketing Service differ from those on agricultural employment of the Census in the Monthly Report on the Labor Force because of the differences in the method of approach, in concepts of employment, and in time of the month for which data are collected. The A.M.S. collects information from the farmer on all persons working on his farm during the week regardless of age, or other jobs held by these workers. The Census data are obtained from about 35,000 farm and nonfarm households on the labor force status of the household members 14 years of age and over for the week including the 12th of the month. In addition, both series are subject to sampling variation and may differ from the results of a complete census.

Wage rates are reported quarterly by the same sample of farm operators that reports employment. The farmer is asked to report average wage rates being paid "at this time" in his locality.

1/ Additional information available in January 1958 issue of Farm Labor.
